Topics list

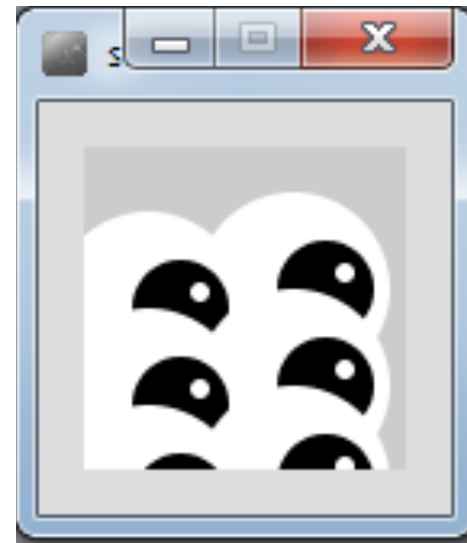

1. Method example: **Eyes**
2. Method example: **X's**
3. **Overloading** methods.
4. Method example: Celcius / Farenheit **Converter**.
5. **Recursion**.

1

*2

*6

Example 3.7 – Drawing a single eye

```
void setup()
{
  size(100,100);
  noStroke();
}
```

```
void draw()
{
  background(204);
  fill(255);
  ellipse(50,50,60,60);           //outer white circle
  fill(0);
  ellipse(50+10, 50, 30, 30);    //black circle
  fill(255);
  ellipse(50+16, 46, 6, 6);      //small, white circle
}
```

What if we wanted to draw two eyes?

```
void draw()
{
  background(204);
  //Right eye
  fill(255);
  ellipse(65,44,60,60); //outer white circle
  fill(0);
  ellipse(65+10, 44, 30, 30); //black circle
  fill(255);
  ellipse(65+16, 44-5, 6, 6); //small, white circle
  //Left eye
  fill(255);
  ellipse(20,50,60,60); //outer white circle
  fill(0);
  ellipse(20+10, 50, 30, 30); //black circle
  fill(255);
  ellipse(20+16, 50-5, 6, 6); //small, white circle
}
```

Each eye takes
six lines of code to draw.

What if we wanted to draw six eyes?

Are we going to repeat the six lines of code
SIX times?

What if we wanted to draw 100 eyes?
→ 600 lines of code!

Example 3.8 – Drawing two eyes

```
void setup()
{
  size(100,100);
  noStroke();
}
```

```
void draw()
{
  background(204);
  eye(65,44);
  eye(20,50);
}
```

```
void eye (int x, int y)
{
  fill(255);
  ellipse(x,y,60,60);      //outer white circle
  fill(0);
  ellipse(x+10, y, 30, 30); //black circle
  fill(255);
  ellipse(x+16, y-5, 6, 6); //small, white circle
}
```

Example 3.9 – Drawing six eyes

```
void setup()
{
  size(100,100);
  noStroke();
}
```

```
void draw()
{
  background(204);
  eye(65,44),
  eye(20,50);
  eye(65,74);
  eye(20,80);
  eye(65,104);
  eye(20,110);
}
```

```
void eye (int x, int y)
{
  fill(255);
  ellipse(x,y,60,60);
  fill(0);
  ellipse(x+10, y, 30, 30);
  fill(255);
  ellipse(x+16, y-5, 6, 6);
}
```

Topics list

1. Method example: **Eyes**
2. Method example: **X's**
3. **Overloading** methods.
4. Method example: Celcius / Farenheit **Converter**.
5. **Recursion**.

How about this solution?

```
void setup() {  
  size(100,100);  
}
```

```
void draw(){  
  background(204);  
  //draw thick, light gray x  
  stroke(160);  
  strokeWidth(20);  
  line(0,5,60,65);  
  line(60,5,0,65);  
  //draw medium, black x  
  stroke(0);  
  strokeWidth(10);  
  line(30,20,90,80);  
  line(90,20,30,80);  
  //draw thin, white x  
  stroke(255);  
  strokeWidth(2);  
  line(20,38,80,98);  
  line(80,38,20,98);  
}
```

Code duplication

```
//draw thick, light gray x  
stroke(160);  
strokeWeight(20);  
line(0,5,60,65);  
line(60,5,0,65);
```

```
//draw medium, black x  
stroke(0);  
strokeWeight(10);  
line(30,20,90,80);  
line(90,20,30,80);
```

```
//draw thin, white x  
stroke(255);  
strokeWeight(2);  
line(20,38,80,98);  
line(80,38,20,98);
```

A solution with methods

- We will incrementally build a solution that uses **methods** to produce this output...

Example 3.10 – using a method to draw a thick, light gray X

```
void draw()  
{  
    background(204);  
    drawX();  
}
```

```
void drawX()  
{  
    //draw thick, light gray x  
    stroke(160);  
    strokeWeight(20);  
    line(0,5,60,65);  
    line(60,5,0,65);  
}
```

No parameters

Example 3.11 – drawing a thick X, passing colour as a parameter.

```
void draw()  
{  
    background(204);  
    drawX(0);  
}
```

```
void drawX (int gray)  
{  
    stroke(gray);  
    strokeWeight(20);  
    line(0,5,60,65);  
    line(60,5,0,65);  
}
```

1 parameter

Example 3.12 – drawing X, passing colour and weight.

```
void draw()  
{  
    background(204);  
    drawX(0, 30);  
}
```

```
void drawX (int gray, int weight)  
{  
    stroke (gray);  
    strokeWeight (weight);  
    line(0,5,60,65);  
    line(60,5,0,65);  
}
```

2 parameters

Example 3.13 – drawing X, passing colour, weight, position, size

```
void drawX (int gray, int weight, int x, int y, int size)
{
  stroke (gray);
  strokeWeight (weight);
  line(x, y, x+size, y+size);
  line(x+size, y, x, y+size);
}
```

```
void draw()
{
  background(204);
  drawX(0, 30, 40, 30, 36);
}
```

5 parameters

Example 3.14 – drawing multiple Xs

```
void drawX (int gray, int weight, int x, int y, int size)
{
    stroke(gray);
    strokeWeight(weight);
    line(x, y, x+size, y+size);
    line(x+size, y, x, y+size);
}
```

```
void draw()
{
    background(204);
    drawX(160, 20, 0, 5, 60);
    drawX(0, 10, 30, 20, 60);
    drawX(255, 2, 20, 38, 60);
}
```

Example 3.15 – drawing multiple Xs using a for loop

```
void draw()
{
    background(204);
    for (int i = 0; i < 20; i++){
        drawX(200-i*10, (20-i)*2, i, i/2, 70);
    }
}
```

```
void drawX(int gray, int weight, int x, int y, int size)
{
    stroke(gray);
    strokeWeight(weight);
    line(x, y, x+size, y+size);
    line(x+size, y, x, y+size);
}
```

Topics list

1. Method example: **Eyes**
2. Method example: **X's**
3. **Overloading** methods.
4. Method example: Celcius / Farenheit **Converter**.
5. **Recursion**.

Overloaded methods

- Multiple methods can have the **same name**, once they have a **different parameter list**.
- In the previous examples, we wrote the following methods:

– void drawX ()	
– void drawX (int gray)	
– void drawX (int gray, int weight)	
– void drawX (int gray, int weight, int x, int y, int size)	

Same Name

Different Parameter List

Overloaded methods

Method signature	Parameter List
void drawX ()	no parameter
void drawX (int gray)	int
void drawX (int gray, int weight)	int, int
void drawX (int gray, int weight, int x, int y, int size)	int, int, int, int, int

Overloaded methods

- A program can have two or more methods with the same name, only if their parameter list is different.
- When Java is checking that a parameter list is different, it is not checking the name of the variables, it is **checking the data type** of the variables e.g. this is permitted as the **data type is different**:
 - void drawX (int gray)
 - void drawX (float gray)

Data types must be different
for a method with the same name to be overloaded

Overloaded methods

```
void draw()  
{  
    background(204);  
    drawX(0);  
}
```

Which drawX method
is called and why?

```
void drawX (int gray){  
    stroke(gray);  
    strokeWeight(5);  
    line(0,5,60,65);  
    line(60,5,0,65);  
}
```

```
void drawX (float gray){  
    stroke(gray);  
    strokeWeight(20);  
    line(0,5,60,65);  
    line(60,5,0,65);  
}
```

Overloaded methods

- When you call a method, Java **matches the number and type of the arguments** you passed to the method, with all the declared methods.
- When a match is found, Java invokes that method
e.g.

drawX (0)

calls

void **drawX (int gray)**

drawX (0.0)

calls

void **drawX (float gray)**

Topics list

1. Method example: **Eyes**
2. Method example: **X's**
3. **Overloading** methods.
4. Method example: Celcius / Farenheit **Converter.**
5. **Recursion.**

Example 3.16 – Fahrenheit to Celsius

```
void setup()
{
  float celsius = fahrenheitToCelsius (451.0);
  println("Celsius value is: " + celsius);
}
```

Fahrenheit
value is
hardcoded
as a literal.

Celsius value is: 232.77779

Return type

```
float fahrenheitToCelsius (float fahrenheit)
{
  float result = (fahrenheit - 32.0) * (5.0/9.0);
  return result;
}
```

Example 3.16 – Updated

```
float fahrenheitToCelsius (float fahrenheit)
{
    float result = (fahrenheit - 32.0) * (5.0/9.0);
    return result;
}
```

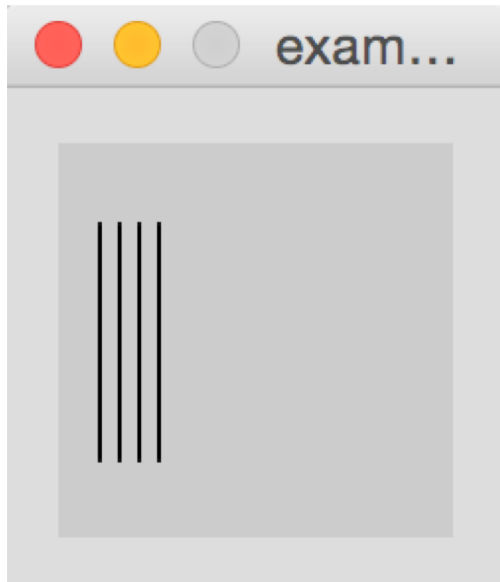

both methods are
exactly the same

```
float fahrenheitToCelsius (float fahrenheit)
{
    return (fahrenheit - 32.0) * (5.0/9.0);
}
```

Topics list

1. Method example: **Eyes**
2. Method example: **X's**
3. **Overloading** methods.
4. Method example: Celcius / Farenheit **Converter**.
5. **Recursion**.

Example 3.17 – drawLines – for loop

```
void setup()
{
  size(100,100);
  drawLines(10,4);
}
```

```
void drawLines (int xStart, int numLines)
{
  for (int i = 0; i < numLines; numLines--)
  {
    line (xStart, 20, xStart, 80);
    xStart += 5;
  }
}
```

NOTE

instead of incrementing the loop control variable *i* as normal (e.g. *i++*)
the condition is being reduced back to 0
(by decrementing *numLines*)

Recursion

- A method can contain a **line of code, that calls itself.**
 - This is called **recursion.**
- To stop the infinite calling of the method, it is necessary to have some way for the method to **exit.**
 - This is called the ***base case.***
 - You continually work towards the base case.

Example 3.17 – drawLines – recursion

```
void setup()  
{  
  size(100,100);  
  drawLines(10,4);  
}
```

```
void drawLines (int x, int num)  
{  
  line (x, 20, x, 80);  
  if (num > 1)  
  {  
    drawLines (x+5, num-1);  
  }  
}
```

Example 3.17

```
void drawLines (int x, int num){  
    line (x, 20, x, 80);  
    if (num > 1)  
    {  
        drawLines (x+5, num-1);  
    }  
}
```

drawLines (10, 4);
line (10, 20, 10, 80);
x=10, num=4 (is > 1)

drawLines (15, 3);
line (15, 20, 15, 80);
x=15, num=3 (is > 1)

drawLines (20, 2);
line (20, 20, 20, 80);
x=20, num=2 (is > 1)

drawLines (25, 1);
line (25, 20, 25, 80);
x=25, num=1 (is NOT > 1)

Successive Method Calls

Having reached the base case, return back up the call stack to the original call

Base case met

Summary

1. Method example: **Eyes**
2. Method example: **X's**
3. **Overloading** methods.
4. Method example: Celcius / Farenheit **Converter**.
5. **Recursion**.
